

EXHIBIT K

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

Exhibit F-10

Based on Headwater's apparent positions as to the scope of the patent's claims, as best they can be deciphered, the reference(s) charted below anticipate(s) or at least render(s) obvious the identified claims. The portions of the prior art system documents cited below are not exhaustive but are exemplary in nature. Additional citations may be found in the cover pleading.

This disclosure is not an admission that Samsung concedes any claim construction implied or suggested by Headwater's apparent positions as to the scope of the patent's claims, nor is it an admission by Samsung that any of its products are covered by or infringe the patent's claims, particularly when they are properly construed and applied. Samsung is not taking any claim construction positions through this disclosure, including whether the preamble is a limitation.

Samsung reserves the right to rely on additional citations or sources of evidence that also may be applicable, or that may become applicable in light of claim construction, changes in Headwater's infringement contentions, and/or information obtained during discovery as the case progresses. Samsung further reserves the right to amend or supplement this claim chart at a later date as more fully set forth in the Invalidity Contentions. For example, Defendants are currently in the process of taking discovery from non-parties including Nokia, HMD, Citrix, Google, Apple, and Microsoft. Accordingly, Defendants reserve the right to modify, amend, and/or supplement these contentions as information becomes available from non-parties.

Android is mobile device operating system that was initially released in September 2008. Applications (or "apps") can be installed on mobile devices that run Android. Any mobile device that predates the '976 patent, running an Android version with one or more apps that also predate the '976 patent, qualifies as prior art under at least pre-AIA 35 U.S.C. §§ 102(a)/(b). Such a device was known, used, offered for sale, and/or sold in the United States before the '976 patent.

Exemplary mobile devices that predate the '976 patent and were publicly available before the earliest possible priority date include:¹

- HTC Dream/T-Mobile G1 (released September 2008)
- Samsung GT-I7500 Galaxy (released June 2009)

¹ See, e.g., SAMSUNG_PRIORART0000001-334; SAMSUNG_PRIORART0005174-76; SAMSUNG_PRIORART0005177-317; SAMSUNG_PRIORART0005416-19; SAMSUNG_PRIORART0005420-23; SAMSUNG_PRIORART0005424-28; SAMSUNG_PRIORART0005429-44; SAMSUNG_PRIORART0005445-48; SAMSUNG_PRIORART0005449-52; SAMSUNG_PRIORART0005453-57; SAMSUNG_PRIORART0005458-71; SAMSUNG_PRIORART0005472-77; SAMSUNG_PRIORART0005478-84; SAMSUNG_PRIORART0005485-86; SAMSUNG_PRIORART0005488-5624.

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

- Nexus One (released January 2010)

Exemplary Android versions that predate the '976 patent and were publicly available before the earliest possible priority date include:

2

- Android 1.0 (released September 2008)
- Android 1.1 (released February 2009)
- Android Cupcake (1.5) (released April 2009)
- Android Donut (1.6) (released September 2009)
- Android Eclair (2.0, 2.0.1, 2.1) (released October 2009 - January 2010)
- Android Froyo (2.2) (released May 20, 2010)

² See, e.g., SAMSUNG_PRIORART0003998; SAMSUNG_PRIORART0004085; SAMSUNG_PRIORART0004081; SAMSUNG_PRIORART0004086; SAMSUNG_PRIORART0004083; SAMSUNG_PRIORART0004084; GOOG-HEADWATER-000000001-123; HDWTR-GOOG00001-GOOG00013; SAMSUNG_PRIORART0005042; SAMSUNG_PRIORART0005062; SAMSUNG_PRIORART0005350; SAMSUNG_PRIORART0005351; SAMSUNG_PRIORART0005352; SAMSUNG_PRIORART0005353; SAMSUNG_PRIORART0005354; SAMSUNG_PRIORART0005355; SAMSUNG_PRIORART0005356; SAMSUNG_PRIORART0005357; SAMSUNG_PRIORART0005358; SAMSUNG_PRIORART0005359; SAMSUNG_PRIORART0005360; SAMSUNG_PRIORART0005361; SAMSUNG_PRIORART0005362; SAMSUNG_PRIORART0005363; SAMSUNG_PRIORART0005364; SAMSUNG_PRIORART0005046; SAMSUNG_PRIORART0005043; SAMSUNG_PRIORART0005044; SAMSUNG_PRIORART0005045; SAMSUNG_PRIORART0005054; SAMSUNG_PRIORART0005055; SAMSUNG_PRIORART0005056; SAMSUNG_PRIORART0005057; SAMSUNG_PRIORART0005058; SAMSUNG_PRIORART0005059; SAMSUNG_PRIORART0005060; SAMSUNG_PRIORART0005061; SAMSUNG_PRIORART0005318; SAMSUNG_PRIORART0005398; SAMSUNG_PRIORART0005047-53; SAMSUNG_PRIORART0005063-65; SAMSUNG_PRIORART0005066-74; SAMSUNG_PRIORART0005075-135; SAMSUNG_PRIORART0005136-52; SAMSUNG_PRIORART0005153-70; SAMSUNG_PRIORART0005171-73; SAMSUNG_PRIORART0005319-49; SAMSUNG_PRIORART0005365-74; SAMSUNG_PRIORART0005375-83; SAMSUNG_PRIORART0005384-94; SAMSUNG_PRIORART0005395-97; SAMSUNG_PRIORART0005487.

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

Android included files³ such as ConnectivityManager, NetworkInfo, NetworkStateTracker, ThrottleManager, TrafficStats, ConnectivityManagerMobileTest, Socket, SocketTest, Power, PowerManager, PowerManagerTest, BatteryManager, and BatteryStats.

Exemplary apps that predate the '976 patent and were publicly available before the earliest possible priority date include:⁴

- JuiceDefender (released January 2010) and its associated add-on application, UltimateJuice (collectively "JuiceDefender App")
- GreenPower (released March 2010)

As specific examples, an HTC Dream/T-Mobile G1, Samsung GT-I7500 Galaxy, or a Nexus One mobile device running any of Android versions 1.0- 2.2 by itself, or with the JuiceDefender or GreenPower applications installed, qualifies as prior art under at least pre-AIA 35 U.S.C. §§ 102(a)/(b). This device was known, used, offered for sale, and/or sold in the United States on or before May 20, 2010. At least the various documents cited in this claim chart describe the functionality of this device.

To the extent it is argued that Android Device with One or More Apps does not disclose or include each and every asserted claim limitation, either expressly or inherently, it would have been obvious to a POSITA to incorporate any of the teachings from the references identified in Exhibits F-01 through F-11, and F-F (whose exemplary citations for each limitation are incorporated herein) into Android Device with One or More Apps. Indeed, it would have been obvious to make such combinations and a POSITA would have had reason and motivation to make such combinations at least for reasons described herein and in the cover pleading.

'976 Claims	Android Device with One or More Apps
[1 pre] A wireless end-user device, comprising:	<p>To the extent the preamble is a limitation, Android Device with One or More Apps discloses and/or renders obvious this element. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><u>Nexus One</u> The Nexus One is an example of an Android smartphone.</p>

³ The files listed are Java source files, so the filenames are ConnectivityManager.java, NetworkInfo.java, etc., except as noted.

⁴ See, e.g., SAMSUNG_PRIORART0000335-SAMSUNG_PRIORART0000383; POUZERATE0000001-POUZERATE0000261.

	<p data-bbox="594 282 947 318">Data synchronization</p> <p data-bbox="594 367 1703 561">Some Google applications on your phone (Gmail, Calendar, and Contacts) give you access to the same personal information that you can add, view, and edit on your computer using Google Web applications. This means that when you add, change, or delete your information in any of these applications on the Web, the updated information also appears on your phone, and vice versa. Also, if you lose your phone or if your phone is destroyed, your personal information is not lost and will appear, as before, on a replacement phone.</p> <p data-bbox="594 586 1692 683">This mirroring of information happens through over-the-air data synchronization, or data "syncing". Data syncing occurs in the background and shouldn't ever get in your way. You'll know your data is being synchronized when you see this icon in the status bar: .</p> <p data-bbox="594 708 1686 769">Because sending large amounts of data back and forth over the air can take time and require considerable bandwidth, there are some settings on the phone that allow you to control data sync.</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

Sync by application

To control synchronization for Gmail, Calendar, and Contacts, do the following:

- 1 Press **HOME**, then press **MENU** and select **Settings**.
- 2 Select **Data synchronization**.

When any of the applications are synchronizing, you will see the "sync" icon: . You will also see the last time your data was synchronized.

- 3 By default, the personal information in Gmail, Calendar, and Contacts will sync whenever you make a change or receive a new message. You can change this behavior:

Auto-sync	When selected, Auto-sync will sync Gmail, Calendar, and Contacts automatically, as you make changes or receive new messages. When OFF, information will not be synced automatically, although you can force a sync by using the individual application check boxes described below.
Gmail	Clear this check box to exclude Gmail from auto-sync. To force a sync, either clear the check box then select it, or press MENU and select Sync now . To control sync by Gmail label, you must do so from the Gmail settings screen. Read more in "Select labels to synchronize" on page 46.
Calendar	Clear this check box to exclude Calendar from auto-sync. To force a sync, either clear the check box then select it, or press MENU and select Sync now .
Contacts	Clear this check box to exclude Contacts from auto-sync. To force a sync, either clear the check box then select it, or press MENU and select Sync now .
Cancel sync	During a sync you can stop it by pressing MENU and selecting Cancel sync .
Sync problems	If you see this icon  to the left of the sync check box, then there was a temporary problem with the data synchronization. Check your data connection and try again later.

U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>* <p>An activity has essentially four states:</p></p> <p>* </p> <p>* If an activity in the foreground of the screen (at the top of the stack),</p> <p>* it is active or running. </p> <p>* If an activity has lost focus but is still visible (that is, a new non-full-sized or transparent activity has focus on top of your activity), it</p> <p>* is paused. A paused activity is completely alive (it maintains all state and member information and remains attached to the window manager), but can be killed by the system in extreme low memory situations.</p> <p>* If an activity is completely obscured by another activity,</p> <p>* it is stopped. It still retains all state and member information, however, it is no longer visible to the user so its window is hidden and it will often be killed by the system when memory is needed elsewhere.</p> <p>* If an activity is paused or stopped, the system can drop the activity from memory by either asking it to finish, or simply killing its process. When it is displayed again to the user, it must be completely restarted and restored to its previous state.</p> <p>* </p> <p>* <p>The following diagram shows the important state paths of an Activity.</p> <p>* The square rectangles represent callback methods you can implement to perform operations when the Activity moves between states. The colored ovals are major states the Activity can be in.</p></p> <p>* <p></p> <p></p> <p>* The entire lifetime of an activity happens between the first call</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none"> * to { @link android.app.Activity#onCreate } through to a single final call * to { @link android.app.Activity#onDestroy }. An activity will do all setup * of "global" state in onCreate(), and release all remaining resources in * onDestroy(). For example, if it has a thread running in the background * to download data from the network, it may create that thread in onCreate() * and then stop the thread in onDestroy(). * * The visible lifetime of an activity happens between a call to * { @link android.app.Activity#onStart } until a corresponding call to * { @link android.app.Activity#onStop }. During this time the user can see the * activity on-screen, though it may not be in the foreground and interacting * with the user. Between these two methods you can maintain resources that * are needed to show the activity to the user. For example, you can register * a { @link android.content.BroadcastReceiver } in onStart() to monitor for changes * that impact your UI, and unregister it in onStop() when the user an no * longer see what you are displaying. The onStart() and onStop() methods * can be called multiple times, as the activity becomes visible and hidden * to the user. * * The foreground lifetime of an activity happens between a call to * { @link android.app.Activity#onResume } until a corresponding call to * { @link android.app.Activity#onPause }. During this time the activity is * in front of all other activities and interacting with the user. An activity * can frequently go between the resumed and paused states -- for example when * the device goes to sleep, when an activity result is delivered, when a new * intent is delivered -- so the code in these methods should be fairly * lightweight. * * * <p>The entire lifecycle of an activity is defined by the following * Activity methods. All of these are hooks that you can override

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>* to do appropriate work when the activity changes state. All</p> <p>* activities will implement { @link android.app.Activity#onCreate }</p> <p>* to do their initial setup; many will also implement</p> <p>* { @link android.app.Activity#onPause } to commit changes to data and</p> <p>* otherwise prepare to stop interacting with the user. You should always</p> <p>* call up to your superclass when implementing these methods.</p></p> <p>* </p> <p><tr><th colspan="2" align="left" border="0">{ @link android.app.Activity#onStop onStop()}</th></p> <p>* <td>Called when the activity is no longer visible to the user, because</p> <p>* another activity has been resumed and is covering this one. This</p> <p>* may happen either because a new activity is being started, an existing</p> <p>* one is being brought in front of this one, or this one is being</p> <p>* destroyed.</p> <p>* <p>Followed by either <code>onRestart()</code> if</p> <p>* this activity is coming back to interact with the user, or</p> <p>* <code>onDestroy()</code> if this activity is going away.</td></p> <p>* <td align="center">Yes</td></p> <p>* <td align="center"><code>onRestart()</code> or
</p> <p>* <code>onDestroy()</code></td></p> <p>* </tr></p> <p>* <p>The Android system attempts to keep application process around for as</p> <p>* long as possible, but eventually will need to remove old processes when</p> <p>* memory runs low. As described in Activity</p> <p>* Lifecycle, the decision about which process to remove is intimately</p> <p>* tied to the state of the user's interaction with it. In general, there</p> <p>* are four states a process can be in based on the activities running in it,</p> <p>* listed here in order of importance. The system will kill less important</p> <p>* processes (the last ones) before it resorts to killing more important</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>* processes (the first ones).</p> <p>* * * <p>The foreground activity (the activity at the top of the screen * that the user is currently interacting with) is considered the most important. * Its process will only be killed as a last resort, if it uses more memory * than is available on the device. Generally at this point the device has * reached a memory paging state, so this is required in order to keep the user * interface responsive. * <p>A visible activity (an activity that is visible to the user * but not in the foreground, such as one sitting behind a foreground dialog) * is considered extremely important and will not be killed unless that is * required to keep the foreground activity running. * <p>A background activity (an activity that is not visible to * the user and has been paused) is no longer critical, so the system may * safely kill its process to reclaim memory for other foreground or * visible processes. If its process needs to be killed, when the user navigates * back to the activity (making it visible on the screen again), its * { @link #onCreate } method will be called with the savedInstanceState it had previously * supplied in { @link #onSaveInstanceState } so that it can restart itself in the same * state as the user last left it. * <p>An empty process is one hosting no activities or other * application components (such as { @link Service } or * { @link android.content.BroadcastReceiver } classes). These are killed very * quickly by the system as memory becomes low. For this reason, any * background operation you do outside of an activity must be executed in the * context of an activity BroadcastReceiver or Service to ensure that the system * knows it needs to keep your process around. * </p>

'976 Claims	Android Device with One or More Apps
	<pre> public List<RunningTaskInfo> getRunningTasks(int maxNum) throws SecurityException { try { return (List<RunningTaskInfo>)ActivityManagerNative.getDefault() .getTasks(maxNum, 0, null); } catch (RemoteException e) { // System dead, we will be dead too soon! return null; } } </pre> <p>/** * Set to true if the service has asked to run as a foreground process. */ public boolean foreground;</p> <p><u>Android 1.6</u></p> <p><u>SAMSUNG PRIORART0005350, Fundamentals.jd</u></p> <p>Activities</p> <p>An <i>activity</i> presents a visual user interface for one focused endeavor the user can undertake. For example, an activity might present a list of menu items users can choose from or it might display photographs along with their captions. A text messaging application might have one activity that shows a list of contacts to send messages to, a second activity to write the message to the chosen contact, and other activities to review old messages or change settings. Though they work together to form a cohesive user interface, each activity is independent of the others. Each one is implemented as a subclass of the { @link android.app.Activity } base class.</p> <p>An application might consist of just one activity or, like the text messaging application just mentioned, it may contain several. What the activities are, and how many there are depends, of</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>course, on the application and its design. Typically, one of the activities is marked as the first one that should be presented to the user when the application is launched. Moving from one activity to another is accomplished by having the current activity start the next one.</p> <p>Each activity is given a default window to draw in. Typically, the window fills the screen, but it might be smaller than the screen and float on top of other windows. An activity can also make use of additional windows — for example, a pop-up dialog that calls for a user response in the midst of the activity, or a window that presents users with vital information when they select a particular item on-screen.</p> <p>The visual content of the window is provided by a hierarchy of views — objects derived from the base { @link android.view.View } class. Each view controls a particular rectangular space within the window. Parent views contain and organize the layout of their children. Leaf views (those at the bottom of the hierarchy) draw in the rectangles they control and respond to user actions directed at that space. Thus, views are where the activity's interaction with the user takes place. For example, a view might display a small image and initiate an action when the user taps that image. Android has a number of ready-made views that you can use — including buttons, text fields, scroll bars, menu items, check boxes, and more.</p> <p>A view hierarchy is placed within an activity's window by the { @link android.app.Activity#setContentView Activity.setContentView() } method. The <i>content view</i> is the View object at the root of the hierarchy. (See the separate User Interface document for more information on views and the hierarchy.)</p> <p>Services</p> <p>A <i>service</i> doesn't have a visual user interface, but rather runs in the background for an indefinite period of time. For example, a service might play background music as the user attends to other matters, or it might fetch data over the network or calculate something and provide the result to activities that need it. Each service extends the { @link android.app.Service } base class.</p> <p>A prime example is a media player playing songs from a play list. The player application would probably have one or more activities that allow the user to choose songs and start playing them. However, the music playback itself would not be handled by an activity because users will expect the music to keep playing even after they leave the player and begin something different. To keep the music going, the media player activity could start a service to run in the background. The</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>system would then keep the music playback service running even after the activity that started it leaves the screen.</p> <p>It's possible to connect to (bind to) an ongoing service (and start the service if it's not already running). While connected, you can communicate with the service through an interface that the service exposes. For the music service, this interface might allow users to pause, rewind, stop, and restart the playback.</p> <p>Like activities and the other components, services run in the main thread of the application process. So that they won't block other components or the user interface, they often spawn another thread for time-consuming tasks (like music playback). See Processes and Threads, later.</p> <p>All the activities in a task move together as a unit. The entire task (the entire activity stack) can be brought to the foreground or sent to the background. Suppose, for instance, that the current task has four activities in its stack — three under the current activity. The user presses the HOME key, goes to the application launcher, and selects a new application (actually, a new <i>task</i>). The current task goes into the background and the root activity for the new task is displayed. Then, after a short period, the user goes back to the home screen and again selects the previous application (the previous task). That task, with all four activities in the stack, comes forward. When the user presses the BACK key, the screen does not display the activity the user just left (the root activity of the previous task). Rather, the activity on the top of the stack is removed and the previous activity in the same task is displayed.</p> <p>As noted above, there's never more than one instance of a "{ @code singleTask}" or "{ @code singleInstance}" activity, so that instance is expected to handle all new intents. A "{ @code singleInstance}" activity is always at the top of the stack (since it is the only activity in the task), so it is always in position to handle the intent. However, a "{ @code singleTask}" activity may or may not have other activities above it in the stack. If it does, it is not in position to handle the intent, and the intent is dropped. (Even though the intent is dropped, its arrival would have caused the task to come to the foreground, where it would remain.)</p> <p>An activity has essentially three states:</p> <ul style="list-style-type: none"> • It is <i>active</i> or <i>running</i> when it is in the foreground of the screen (at the top of the activity stack for the current task). This is the activity that is the focus for the user's actions.

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none"> • It is <i>paused</i> if it has lost focus but is still visible to the user. That is, another activity lies on top of it and that activity either is transparent or doesn't cover the full screen, so some of the paused activity can show through. A paused activity is completely alive (it maintains all state and member information and remains attached to the window manager), but can be killed by the system in extreme low memory situations. • It is <i>stopped</i> if it is completely obscured by another activity. It still retains all state and member information. However, it is no longer visible to the user so its window is hidden and it will often be killed by the system when memory is needed elsewhere. <p>Taken together, these seven methods define the entire lifecycle of an activity. There are three nested loops that you can monitor by implementing them:</p> <ul style="list-style-type: none"> • The entire lifetime of an activity happens between the first call to { @link android.app.Activity#onCreate onCreate()} through to a single final call to { @link android.app.Activity#onDestroy onDestroy()}. An activity does all its initial setup of "global" state in { @code onCreate()}, and releases all remaining resources in { @code onDestroy()}. For example, if it has a thread running in the background to download data from the network, it may create that thread in { @code onCreate()} and then stop the thread in { @code onDestroy()}. • The visible lifetime of an activity happens between a call to { @link android.app.Activity#onStart onStart()} until a corresponding call to { @link android.app.Activity#onStop onStop()}. During this time, the user can see the activity on-screen, though it may not be in the foreground and interacting with the user. Between these two methods, you can maintain resources that are needed to show the activity to the user. For example, you can register a { @link android.content.BroadcastReceiver} in { @code onStart()} to monitor for changes that impact your UI, and unregister it in { @code onStop()} when the user can no longer see what you are displaying. The { @code onStart()} and { @code onStop()} methods can be called multiple times, as the activity alternates between being visible and hidden to the user. • The foreground lifetime of an activity happens between a call to { @link android.app.Activity#onResume onResume()} until a corresponding call to { @link android.app.Activity#onPause onPause()}. During this time, the activity is in front of all other activities on screen and is interacting with the user. An activity can frequently transition between the resumed and paused states — for example, { @code onPause()} is called when the device goes

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps								
	<p>to sleep or when a new activity is started, { @code onResume() } is called when an activity result or a new intent is delivered. Therefore, the code in these two methods should be fairly lightweight.</p> <table><tr><td>{@link android.app.Activity#onStart onStart() }</td><td>Called just before the activity becomes visible to the user.</td><td></td><td>{@code onResume() }</td></tr><tr><td></td><td>Followed by {@code onResume() } if the activity comes to the foreground, or {@code onStop() } if it becomes hidden.</td><td>No</td><td>or {@code onStop() }</td></tr></table> <p>Processes and lifecycles</p> <p>The Android system tries to maintain an application process for as long as possible, but eventually it will need to remove old processes when memory runs low. To determine which processes to keep and which to kill, Android places each process into an "importance hierarchy" based on the components running in it and the state of those components. Processes with the lowest importance are eliminated first, then those with the next lowest, and so on. There are five levels in the hierarchy. The following list presents them in order of importance:</p> <ol style="list-style-type: none">1. A foreground process is one that is required for what the user is currently doing. A process is considered to be in the foreground if any of the following conditions hold:<ul style="list-style-type: none">○ It is running an activity that the user is interacting with (the Activity object's {@link android.app.Activity#onResume onResume() } method has been called).○ It hosts a service that's bound to the activity that the user is interacting with.○ It has a {@link android.app.Service } object that's executing one of its lifecycle callbacks ({@link android.app.Service#onCreate onCreate() }), {@link android.app.Service#onStart onStart() }, or {@link android.app.Service#onDestroy onDestroy() }).○ It has a {@link android.content.BroadcastReceiver } object that's executing its {@link android.content.BroadcastReceiver#onReceive onReceive() } method. <p>Only a few foreground processes will exist at any given time. They are killed only as a last resort — if memory is so low that they cannot all continue to run. Generally, at that point, the device has reached a memory paging state, so killing some foreground processes is required to keep the user interface responsive.</p>	{@link android.app.Activity#onStart onStart() }	Called just before the activity becomes visible to the user.		{@code onResume() }		Followed by {@code onResume() } if the activity comes to the foreground, or {@code onStop() } if it becomes hidden.	No	or {@code onStop() }
{@link android.app.Activity#onStart onStart() }	Called just before the activity becomes visible to the user.		{@code onResume() }						
	Followed by {@code onResume() } if the activity comes to the foreground, or {@code onStop() } if it becomes hidden.	No	or {@code onStop() }						

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>2. A visible process is one that doesn't have any foreground components, but still can affect what the user sees on screen. A process is considered to be visible if either of the following conditions holds:</p> <ul style="list-style-type: none"> ○ It hosts an activity that is not in the foreground, but is still visible to the user (its { @link android.app.Activity#onPause onPause() } method has been called). This may occur, for example, if the foreground activity is a dialog that allows the previous activity to be seen behind it. ○ It hosts a service that's bound to a visible activity. <p>A visible process is considered extremely important and will not be killed unless doing so is required to keep all foreground processes running.</p> <p>3. A service process is one that is running a service that has been started with the { @link android.content.Context#startService startService() } method and that does not fall into either of the two higher categories. Although service processes are not directly tied to anything the user sees, they are generally doing things that the user cares about (such as playing an mp3 in the background or downloading data on the network), so the system keeps them running unless there's not enough memory to retain them along with all foreground and visible processes.</p> <p>4. A background process is one holding an activity that's not currently visible to the user (the Activity object's { @link android.app.Activity#onStop onStop() } method has been called). These processes have no direct impact on the user experience, and can be killed at any time to reclaim memory for a foreground, visible, or service process. Usually there are many background processes running, so they are kept in an LRU (least recently used) list to ensure that the process with the activity that was most recently seen by the user is the last to be killed. If an activity implements its lifecycle methods correctly, and captures its current state, killing its process will not have a deleterious effect on the user experience.</p> <p>5. An empty process is one that doesn't hold any active application components. The only reason to keep such a process around is as a cache to improve startup time the next time a component needs to run in it. The system often kills these processes in order to balance overall system resources between process caches and the underlying kernel caches.</p> <p><u>SAMSUNG PRIORART0005487, Activity</u></p> <p>* <p>An activity has essentially four states:</p></p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none"> * * If an activity in the foreground of the screen (at the top of the stack), * it is active or running. * If an activity has lost focus but is still visible (that is, a new non-full-sized or transparent activity has focus on top of your activity), it is paused. A paused activity is completely alive (it maintains all state and member information and remains attached to the window manager), but can be killed by the system in extreme low memory situations. * If an activity is completely obscured by another activity, it is stopped. It still retains all state and member information, however, it is no longer visible to the user so its window is hidden and it will often be killed by the system when memory is needed elsewhere. * If an activity is paused or stopped, the system can drop the activity from memory by either asking it to finish, or simply killing its process. When it is displayed again to the user, it must be completely restarted and restored to its previous state. * <p>The visible lifetime of an activity happens between a call to</p> <ul style="list-style-type: none"> * { @link android.app.Activity#onStart } until a corresponding call to * { @link android.app.Activity#onStop }. During this time the user can see the activity on-screen, though it may not be in the foreground and interacting with the user. Between these two methods you can maintain resources that are needed to show the activity to the user. For example, you can register a { @link android.content.BroadcastReceiver } in onStart() to monitor for changes that impact your UI, and unregister it in onStop() when the user no longer see what you are displaying. The onStart() and onStop() methods can be called multiple times, as the activity becomes visible and hidden

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>An <i>activity</i> presents a visual user interface for one focused endeavor the user can undertake. For example, an activity might present a list of menu items users can choose from or it might display photographs along with their captions. A text messaging application might have one activity that shows a list of contacts to send messages to, a second activity to write the message to the chosen contact, and other activities to review old messages or change settings. Though they work together to form a cohesive user interface, each activity is independent of the others. Each one is implemented as a subclass of the { @link android.app.Activity } base class.</p> <p>An application might consist of just one activity or, like the text messaging application just mentioned, it may contain several. What the activities are, and how many there are depends, of course, on the application and its design. Typically, one of the activities is marked as the first one that should be presented to the user when the application is launched. Moving from one activity to another is accomplished by having the current activity start the next one.</p> <p>Each activity is given a default window to draw in. Typically, the window fills the screen, but it might be smaller than the screen and float on top of other windows. An activity can also make use of additional windows — for example, a pop-up dialog that calls for a user response in the midst of the activity, or a window that presents users with vital information when they select a particular item on-screen.</p> <p>The visual content of the window is provided by a hierarchy of views — objects derived from the base { @link android.view.View } class. Each view controls a particular rectangular space within the window. Parent views contain and organize the layout of their children. Leaf views (those at the bottom of the hierarchy) draw in the rectangles they control and respond to user actions directed at that space. Thus, views are where the activity's interaction with the user takes place. For example, a view might display a small image and initiate an action when the user taps that image. Android has a number of ready-made views that you can use — including buttons, text fields, scroll bars, menu items, check boxes, and more.</p> <p>A view hierarchy is placed within an activity's window by the { @link android.app.Activity#setContentView Activity.setContentView() } method. The <i>content view</i> is the View object at the root of the hierarchy. (See the separate User Interface document for more information on views and the hierarchy.)</p> <p>Services</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>A <i>service</i> doesn't have a visual user interface, but rather runs in the background for an indefinite period of time. For example, a service might play background music as the user attends to other matters, or it might fetch data over the network or calculate something and provide the result to activities that need it. Each service extends the { @link android.app.Service } base class. A prime example is a media player playing songs from a play list. The player application would probably have one or more activities that allow the user to choose songs and start playing them. However, the music playback itself would not be handled by an activity because users will expect the music to keep playing even after they leave the player and begin something different. To keep the music going, the media player activity could start a service to run in the background. The system would then keep the music playback service running even after the activity that started it leaves the screen.</p> <p>It's possible to connect to (bind to) an ongoing service (and start the service if it's not already running). While connected, you can communicate with the service through an interface that the service exposes. For the music service, this interface might allow users to pause, rewind, stop, and restart the playback.</p> <p>Like activities and the other components, services run in the main thread of the application process. So that they won't block other components or the user interface, they often spawn another thread for time-consuming tasks (like music playback). See Processes and Threads, later.</p> <p>All the activities in a task move together as a unit. The entire task (the entire activity stack) can be brought to the foreground or sent to the background. Suppose, for instance, that the current task has four activities in its stack — three under the current activity. The user presses the HOME key, goes to the application launcher, and selects a new application (actually, a new <i>task</i>). The current task goes into the background and the root activity for the new task is displayed. Then, after a short period, the user goes back to the home screen and again selects the previous application (the previous task). That task, with all four activities in the stack, comes forward. When the user presses the BACK key, the screen does not display the activity the user just left (the root activity of the previous task). Rather, the activity on the top of the stack is removed and the previous activity in the same task is displayed.</p> <p>As noted above, there's never more than one instance of a "{ @code singleTask }" or "{ @code singleInstance }" activity, so that instance is expected to handle all new intents. A "{ @code</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>singleInstance}" activity is always at the top of the stack (since it is the only activity in the task), so it is always in position to handle the intent. However, a "{ @code singleTask}" activity may or may not have other activities above it in the stack. If it does, it is not in position to handle the intent, and the intent is dropped. (Even though the intent is dropped, its arrival would have caused the task to come to the foreground, where it would remain.)</p> <p>An activity has essentially three states:</p> <ul style="list-style-type: none"> • It is <i>active</i> or <i>running</i> when it is in the foreground of the screen (at the top of the activity stack for the current task). This is the activity that is the focus for the user's actions. • It is <i>paused</i> if it has lost focus but is still visible to the user. That is, another activity lies on top of it and that activity either is transparent or doesn't cover the full screen, so some of the paused activity can show through. A paused activity is completely alive (it maintains all state and member information and remains attached to the window manager), but can be killed by the system in extreme low memory situations. • It is <i>stopped</i> if it is completely obscured by another activity. It still retains all state and member information. However, it is no longer visible to the user so its window is hidden and it will often be killed by the system when memory is needed elsewhere. <p>Taken together, these seven methods define the entire lifecycle of an activity. There are three nested loops that you can monitor by implementing them:</p> <ul style="list-style-type: none"> • The entire lifetime of an activity happens between the first call to { @link android.app.Activity#onCreate onCreate()} through to a single final call to { @link android.app.Activity#onDestroy}. An activity does all its initial setup of "global" state in { @code onCreate()}, and releases all remaining resources in { @code onDestroy()}. For example, if it has a thread running in the background to download data from the network, it may create that thread in { @code onCreate()} and then stop the thread in { @code onDestroy()}. • The visible lifetime of an activity happens between a call to { @link android.app.Activity#onStart onStart()} until a corresponding call to { @link android.app.Activity#onStop onStop()}. During this time, the user can see the activity on-screen, though it may not be in the foreground and interacting with the user. Between these two methods, you can maintain resources that are needed to show the activity to the user. For example, you can register a { @link

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps						
	<p>android.content.BroadcastReceiver} in { @code onStart()} to monitor for changes that impact your UI, and unregister it in { @code onStop()} when the user can no longer see what you are displaying. The { @code onStart()} and { @code onStop()} methods can be called multiple times, as the activity alternates between being visible and hidden to the user.</p> <ul style="list-style-type: none">• The foreground lifetime of an activity happens between a call to { @link android.app.Activity#onResume onResume()} until a corresponding call to { @link android.app.Activity#onPause onPause()}. During this time, the activity is in front of all other activities on screen and is interacting with the user. An activity can frequently transition between the resumed and paused states — for example, { @code onPause()} is called when the device goes to sleep or when a new activity is started, { @code onResume()} is called when an activity result or a new intent is delivered. Therefore, the code in these two methods should be fairly lightweight. <table><tr><td rowspan="2">{@link android.app.Activity#onStart onStart()}}</td><td>Called just before the activity becomes visible to the user.</td><td rowspan="2">No</td><td>{@code onResume()}}</td></tr><tr><td>Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.</td><td>or {@code onStop()}}</td></tr></table> <p>Processes and lifecycles</p> <p>The Android system tries to maintain an application process for as long as possible, but eventually it will need to remove old processes when memory runs low. To determine which processes to keep and which to kill, Android places each process into an "importance hierarchy" based on the components running in it and the state of those components. Processes with the lowest importance are eliminated first, then those with the next lowest, and so on. There are five levels in the hierarchy. The following list presents them in order of importance:</p> <ol style="list-style-type: none">6. A foreground process is one that is required for what the user is currently doing. A process is considered to be in the foreground if any of the following conditions hold:<ul style="list-style-type: none">○ It is running an activity that the user is interacting with (the Activity object's { @link android.app.Activity#onResume onResume()} method has been called).○ It hosts a service that's bound to the activity that the user is interacting with.	{@link android.app.Activity#onStart onStart()}}	Called just before the activity becomes visible to the user.	No	{@code onResume()}}	Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.	or {@code onStop()}}
{@link android.app.Activity#onStart onStart()}}	Called just before the activity becomes visible to the user.		No		{@code onResume()}}		
	Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.	or {@code onStop()}}					

Exhibit F-10 to Defendants' Amended Invalidity Contentions

'976 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none"> ○ It has a { @link android.app.Service} object that's executing one of its lifecycle callbacks ({ @link android.app.Service#onCreate onCreate()}, { @link android.app.Service#onStart onStart()}, or { @link android.app.Service#onDestroy onDestroy()}). ○ It has a { @link android.content.BroadcastReceiver} object that's executing its { @link android.content.BroadcastReceiver#onReceive onReceive()} method. <p>Only a few foreground processes will exist at any given time. They are killed only as a last resort — if memory is so low that they cannot all continue to run. Generally, at that point, the device has reached a memory paging state, so killing some foreground processes is required to keep the user interface responsive.</p> <p>7. A visible process is one that doesn't have any foreground components, but still can affect what the user sees on screen. A process is considered to be visible if either of the following conditions holds:</p> <ul style="list-style-type: none"> ○ It hosts an activity that is not in the foreground, but is still visible to the user (its { @link android.app.Activity#onPause onPause()} method has been called). This may occur, for example, if the foreground activity is a dialog that allows the previous activity to be seen behind it. ○ It hosts a service that's bound to a visible activity. <p>A visible process is considered extremely important and will not be killed unless doing so is required to keep all foreground processes running.</p> <p>8. A service process is one that is running a service that has been started with the { @link android.content.Context#startService startService()} method and that does not fall into either of the two higher categories. Although service processes are not directly tied to anything the user sees, they are generally doing things that the user cares about (such as playing an mp3 in the background or downloading data on the network), so the system keeps them running unless there's not enough memory to retain them along with all foreground and visible processes.</p> <p>9. A background process is one holding an activity that's not currently visible to the user (the Activity object's { @link android.app.Activity#onStop onStop()} method has been called). These processes have no direct impact on the user experience, and can be killed at any time to reclaim memory for a foreground, visible, or service process. Usually there are many background processes running, so they are kept in an LRU (least recently used) list to ensure that the process with the activity that was most recently seen by the user is the last to be killed. If an activity</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions

When the user leaves an application, its process is kept around in the background, allowing it to continue working (for example downloading web pages) if needed, and come immediately to the foreground if the user returns to it. If a device never runs out of memory, then Android will keep all of these processes around, truly leaving all applications "running" all of the time.</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p>Explicitly running in the background</p> <p>So far, we have a way for applications to implicitly do work in the background, as long as the process doesn't get killed by Android as part of its regular memory management. This is fine for things like loading web pages in the background, but what about features with harder requirements? Background music playback, data synchronization, location tracking, alarm clocks, etc.</p> <p>For these tasks, the application needs a way to tell Android "I would explicitly like to run at this point." There are two main facilities available to applications for this, represented by two kinds of components they can publish in their manifest: <i>broadcast receivers</i> and <i>services</i>.</p> <h3>Broadcast Receivers</h3> <p>A BroadcastReceiver allows an application to run, for a brief amount of time, in the background as a result of something else happening. It can be used in many ways to build higher-level facilities: for example the AlarmManager allows an application to have a broadcast sent at a certain time in the future, and the LocationManager can send a broadcast when it detects interesting changes in location. Because information about the receiver is part of an application's manifest, Android can find and launch the application even if it isn't running; of course if it already has its process available in the background, the broadcast can very efficiently be directly dispatched to it.</p> <p>When handling a broadcast, the application is given a fixed set of time (currently 10 seconds) in which to do its work. If it doesn't complete in that time, the application is considered to be misbehaving, and its process immediately tossed into the background state to be killed for memory if needed.</p> <p>Broadcast receivers are great for doing small pieces of work in response to an external stimulus, such as posting a notification to the user after being sent a new GPS location report. They are very lightweight, since the application's process only needs to be around while actively receiving the broadcast. Because they are active for a deterministic amount of time, fairly strong guarantees can be made about not killing their process while running. However they are not appropriate for anything of indeterminate length, such as networking.</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
	<p data-bbox="552 277 688 310">Services</p> <p data-bbox="552 354 1503 488">A Service allows an application to implement longer-running background operations. There are actually a lot of other functions that services provide, but for the discussion here their fundamental purpose is for an application to say "hey I would like to continue running even while in the background, until I say I am done." An application controls when its service runs by explicitly starting and stopping the service.</p> <p data-bbox="552 513 1514 695">While services do provide a rich client-server model, its use is optional. Upon starting an application's services, Android simply instantiates the component in the application's process to provide its context. How it is used after that is up to the application: it can put all of the needed code inside of the service itself without interacting with other parts of the application, make calls on other singleton objects shared with other parts of the app, directly retrieve the Service instance from elsewhere if needed, or run it in another process and do a full-blown RPC protocol if that is desired.</p> <p data-bbox="552 719 1507 824">Process management for services is different than broadcast receivers, because an unbounded number of services can ask to be running for an unknown amount of time. There may not be enough RAM to have all of the requesting services run, so as a result no strong guarantees are made about being able to keep them running.</p> <p data-bbox="552 849 1503 1003">If there is too little RAM, processes hosting services will be immediately killed like background processes are. However, if appropriate, Android will remember that these services wish to remain running, and restart their process at a later time when more RAM is available. For example, if the user goes to a web page that requires large amounts of RAM, Android may kill background service processes like sync until the browser's memory needs go down.</p> <p data-bbox="552 1027 1499 1213">Services can further negotiate this behavior by requesting they be considered "foreground." This places the service in a "please don't kill" state, but requires that it include a notification to the user about it actively running. This is useful for services such as background music playback or car navigation, which the user is actively aware of; when you're playing music and using the browser, you can always see the music-playing glyph in the status bar. Android won't try to kill these services, but as a trade-off, ensures the user knows about them and is able to explicitly stop them when desired.</p>

U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
processors are further configured to dynamically change the application of the first differential traffic control policy based on a device usage state.	<i>See, e.g.</i> , the disclosures identified for claims [1 pre]-[1h], [12].
[14] The wireless end-user device of claim 1, wherein the one or more processors configured to classify whether or not the first end-user application, when running, in interacting in the device display foreground with a user perform the classification based at least in part on a state of user interface priority for the application.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.</i>, the disclosures identified for claims [1 pre]-[1h].</p>
[15] The wireless end-user device of claim 1, wherein the one or more processors are further configured to dynamically change the application of the first	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.</i>, the disclosures identified for claims [1 pre]-[1h], [12].</p>

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
differential traffic control policy based on power control state changes for one or more of the modems.	
[16] The wireless end-user device of claim 1, wherein the one or more processors are configured to associate the first end-user application with the first differential traffic control policy based on an application behavior.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h].</p>
[17] The wireless end-user device of claim 1, wherein the differential traffic control policy defines that applications to which the policy applies can only have WWAN network access events during particular time windows.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [12].</p>
[18] The wireless end-user device of claim 1, wherein the one or more	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p>

U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
processors are further configured to update the first differential traffic control policy based on information received from a network element.	<i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h].
[19] The wireless end-user device of claim 1, further comprising an agent to block, modify, remove, or replace, based on the applied differential traffic control policy, user interface messages generated by the first end-user application.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].</p>
[20] The wireless end-user device of claim 1, wherein the one or more processors configured to apply the first differential traffic control policy to disallow Internet service activity on behalf of the first end-user application perform a disallowance of Internet	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9]</p>

U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
service activity by intercepting open, connect, and/or write requests by the first end-user application to a network stack.	
[21] The wireless end-user device of claim 20, wherein the API responds to an intercepted request by the first end-user application by emulating network messaging.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].</p>
[22] The wireless end-user device of claim 21, wherein emulating network messaging comprises responding to a network request from the first end-user application by blocking the request from passing to a network stack and returning to the first end-user application a message indicating the	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].</p>

U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
traffic control policy comprising first, second, and third sub-policies applicable respectively to Internet data service provided using the WWAN modem and three different network types from the network types consisting of 2G, 3G, 4G, home, and roaming.	<i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h].
[25] The wireless end-user device of claim 1, wherein the API comprises a network access API.	Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures: <i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].
[26] The wireless end-user device of claim 1, wherein the one or more network access conditions indicated via the API to the first end-user application comprises information on whether a current connected WWAN is a roaming network or a non-roaming network.	Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures: <i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].

Exhibit F-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 9,143,976

'976 Claims	Android Device with One or More Apps
[27] The wireless end-user device of claim 1, wherein the API informs the first end-user application when it is allowed to access Internet data service that is available via the WWAN modem.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].</p>
[28] The wireless end-user device of claim 1, wherein the API informs the first end-user application of one or more network traffic controls that the first end-user application is expected to implement.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].</p>
[29] The wireless end-user device of claim 1, wherein the API instructs the first end-user particular application to transition to a different state.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre]-[1h], [9].</p>
